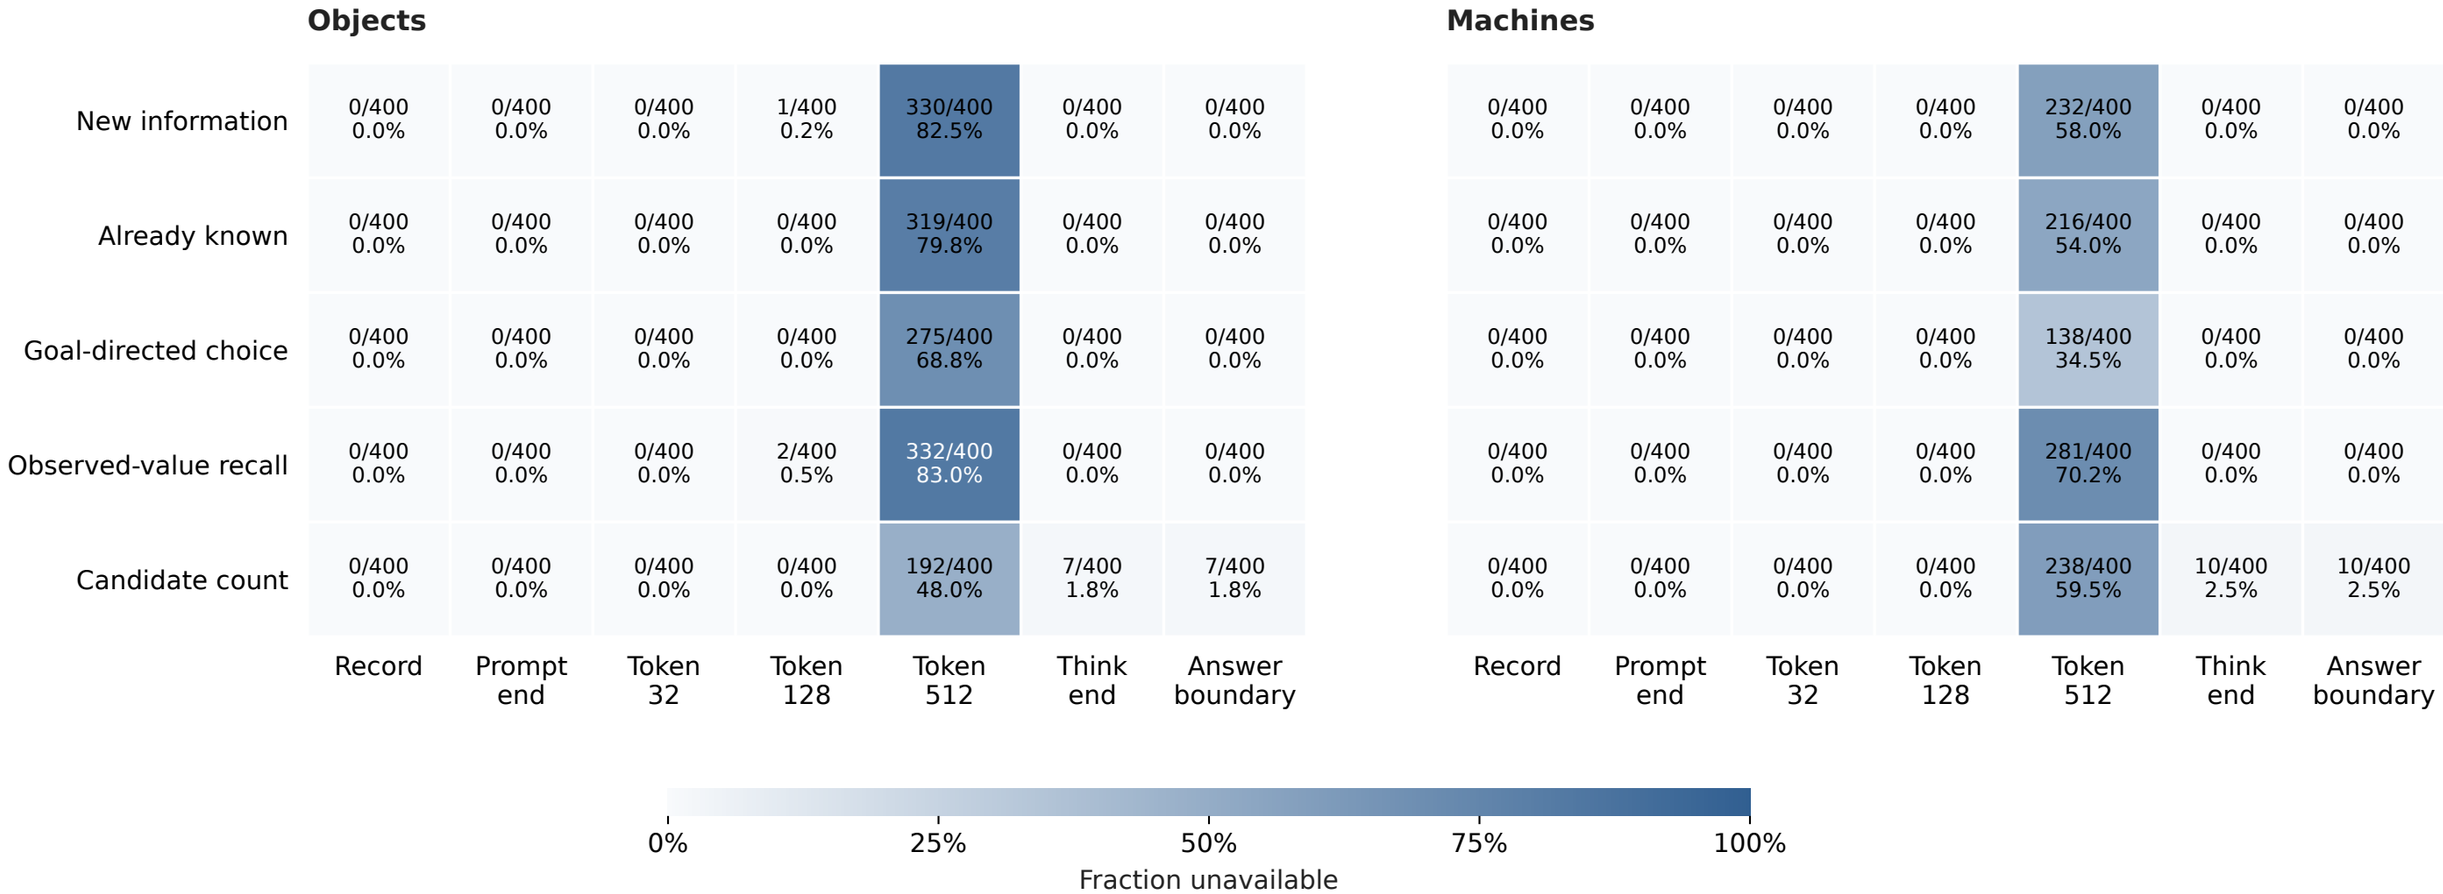
Trajectory positions unavailable for capture

All assigned responses · identical availability across the four captured layers · output cap reached: 18/4,000



Each entry gives unavailable responses / 400 (four cells from 100 world indices); the audit verifies common availability across layers.

A fixed token stage is absent after an earlier completion. Think-end and answer-boundary stages require the corresponding detectable tokens.

Position availability changes the usable sample; this matrix does not show representational strength or a temporal effect.
